

AMENDMENTS TO THE CLAIMS

1. (Currently Amended) A gateway apparatus, arranged between a circuit switched network and an internet protocol network, for transmitting data received from the circuit switched network to the internet protocol network, comprising:

an expansion section for expanding compressed data received from the circuit switched network;

a compression section for compressing the data expanded by the expansion section;

a setting section setting a compression form for compressing the data being transmitted to the internet protocol network, wherein the compression form includes a transmission rate and can be executed by a gateway apparatus relaying the data being transmitted to the internet protocol network to a destination circuit switched network and can be executed by the destination circuit switched network;

a judging section judging whether the compression form set by said setting section coincides with the compression form of the compressed data received from the circuit switched network or not; and

a controller performing control such that

when the compression forms judged by the judging section do not coincide, the compressed data received from the circuit switched network is expanded by said expansion section, the expanded data expanded by said expansion section is compressed by said compression section at the compression form set by said setting section, and the compressed data compressed by said compression section is transmitted to the internet protocol network, and

when the compressed forms are judged to coincide, the compressed data received from the circuit switched network is transmitted to the internet protocol network without processing by said expansion section and said compression section.

2. (Previously Presented) A gateway apparatus, arranged between an internet protocol network and a circuit switched network, for transmitting data received from the internet protocol network to the circuit switched network, comprising:

an expansion section for expanding compressed data received from the internet protocol network;

a compression section for compressing the data expanded by the expansion section;

a setting section setting a compression form for compressing the data being transmitted to the circuit switched network, wherein the compression form includes a transmission rate;

a judging section judging whether the compression form set by said setting section coincides with the compression form of the compressed data received from the internet protocol network or not; and

a controller performing control such that

when the compression forms judged by the judging section do not coincide, the compressed data received from the internet protocol network is expanded by said expansion section, the expanded data expanded by said expansion section is compressed by said compression section at the compression form set by said setting section, and the compressed data compressed by said compression section is transmitted to the circuit switched network, and

when the compressed forms are judged to coincide, the compressed data received from the internet protocol network is transmitted to the circuit switched network without processing by said expansion section and said compression section.

3. (Previously Presented) A network system comprising a first gateway apparatus to which a first circuit switched network is connected, a second gateway apparatus to which a second circuit switched network is connected, and an internet protocol network to which the first gateway apparatus and the second gateway apparatus are connected, wherein

the first gateway apparatus comprising:

a notification section giving information of a CODEC form of compressed data, transmitted from the first circuit switched network to the first gateway apparatus, to the second gateway apparatus as CODEC information when compressed data is transmitted from the first circuit switched network to the second circuit switched network through the internet protocol network; and

a selection section selecting a compression form of the compressed data transmitted from the first gateway apparatus to the second gateway apparatus from information of CODEC forms which are received from the second gateway apparatus and can be executed by the second gateway apparatus,

the second gateway apparatus comprising:

an expansion section expanding the compressed data received from the first gateway apparatus;

a compression section compressing data expanded by the expansion section;

a determination section, when a CODEC form corresponding to the CODEC information received from the notification section can be executed by the second gateway apparatus and when compressed data compressed in the CODEC form can be expanded by the second circuit switched network, determining a compression form corresponding to the CODEC information as a compression form of compressed data transmitted from the second gateway apparatus to the second circuit switched network;

a second notification section giving only information of the CODEC form determined by the determination section to the first gateway apparatus as information of a CODEC form which can be executed by the second gateway apparatus;

a judging section judging whether the compression form selected by the selection section of the first gateway apparatus, for transmitting compressed data from the first gateway apparatus to the second gateway apparatus, coincides with the compression form selected by said determination section for transmitting compressed data from the second gateway apparatus to the second circuit switched network; and

a controller performing control such that

when the compression forms judged by said judging section do not coincide, the compressed data received from the first gateway apparatus is expanded by said expansion section, the expanded data expanded by said expansion section is compressed by said compression section at the compression form set by said determination section, and the compressed data compressed by said compression section is transmitted to the second circuit switched network, and

when the compressed forms are judged to coincide, the compressed data received from the first gateway apparatus is transmitted to the second circuit switched network without processing by said expansion section and said compression section.

4. (Previously Presented) A network system according to claim 3, wherein the first gateway apparatus further comprising:

a second expansion section expanding compressed data received from the first circuit switched network;

a second compression section compressing the data expanded by the second expansion section; and

a second controller transmitting the compressed data received from the first circuit switched network to the internet protocol network without being subjected to expansion/compression processes by the second expansion section and the second compression section when the compression form of the compressed data transmitted from the first circuit switched network to the first gateway apparatus coincides with the compression form selected by the selection section for the compressed data transmitted from the first gateway apparatus to the second gateway apparatus.

5. (Original) A network system according to claim 3, wherein when the determination section cannot decide a CODEC form corresponding to the CODEC information received from the notification section as a compression form of compressed data transmitted from the second gateway apparatus to the second circuit network, the determination section determines a CODEC form of data which can be executed by the second gateway apparatus and expanded by the

second circuit switched network as the compression form of the compressed data transmitted from the second gateway apparatus to the second circuit switched network, and

the second notification section gives, of the CODEC form notified by the notification section and the CODEC form determined by the determination section, only information of the CODEC form in which the transmission rate of the compressed data is low to the first gateway apparatus as information of a CODEC form which can be executed by the second gateway apparatus.

6. (Original) A network system according to claim 4, wherein when the determination section cannot determine a CODEC form corresponding to the CODEC information received from the notification section as a compression form of compressed data transmitted from the second gateway apparatus to the second circuit switched network, the determination section determines a CODEC form of data which can be executed by the second gateway apparatus and expanded by the second circuit switched network as the compression form of the compressed data transmitted from the second gateway apparatus to the second circuit switched network, and

the second notification section gives, of the CODEC form notified by the notification section and the CODEC form determined by the determination section, only information of the CODEC form in which the transmission rate of the compressed data is low to the first gateway apparatus as information of a CODEC form which can be executed by the second gateway apparatus.

7. (Currently Amended) A communication apparatus in which a low-order network and a high-order network are connected to each other, comprising:

an expansion section for expanding compressed data received from the low-order network;

a compression section for compressing the data expanded by the expansion section;

a setting section setting a compression form for compressing the data being transmitting to the high-order network, wherein the compression form includes a transmission rate and can be executed by a communication apparatus relaying the data being transmitted to the high-order network to a destination network and can be executed by the destination network;

a judging section judging whether the compression form set by said setting section coincides with the compression form of the compressed data received from the low-order network or not; and

a controller performing control such that

when the compression forms judged by said judging section do not coincide, the compressed data received from the low-order network is expanded by said expansion section, the expanded data expanded by said expansion section is compressed by said compression section at the compression form set by said setting section, and the compressed data compressed by said compression section is transmitted to the high-order network, and

when the compressed forms are judged to coincide, the compressed data received from the low-order network is transmitted to the high-order network without processing by said expansion section and said compression section.

8. (Currently Amended) A communication apparatus in which a high-order network and a low-order network are connected to each other, comprising:

an expansion section for expanding compressed data received from the high-order network;

a compression section for compressing the data expanded by the expansion section;

a setting section setting a compression form for compressing the data being transmitted to the low-order network, wherein the compression form includes a transmission rate and can be executed by a communication apparatus relaying the data being transmitted to the low-order network to a destination network and can be executed by the destination network;

a judging section judging whether the compression form set by said setting section coincides with the compression form of the compressed data received from the high-order network or not; and

a controller performing control such that

when the compression forms judged by said judging section do not coincide, the compressed data received from the high-order network is expanded by said expansion section, the expanded data expanded by said expansion section is compressed by said compression section at the compression form set by said setting section, and the compressed data compressed by said compression section is transmitted to the low-order network, and

when the compressed forms are judged to coincide, the compressed data received from the high-order network is transmitted to the low-order network without processing by said expansion section and said compression section.
